Colonial Pipeline Oil Spill *A 30-year Retrospective* 

DWSPP Quarterly Meeting August 2, 2023 Cherie Schultz, PhD, ICPRB CO-OP Section

# Spill summary

- Rupture occurred March 28, 1993
- 407,736 gallons of No. 2 fuel oil were released
- Oil flowed into Sugarland Run and then into the Potomac River
- Rupture was attributed to damage from 1986 construction activity
- \$25M cleanup costs + \$3.6M-\$4.0M 1998 settlement with US, DC & VA

## Day 1 timeline – March 28, 1993

- 8:48 AM: Colonial operators noticed pressure drop; pumps and valves shut at two pipeline stations – 10 miles SW and 35 miles NE
- 9:00 AM: Police officer observed a 50- to 100-foot geyser of oil behind Reston Hospital Center
- 9:20 AM: County HazMat team arrived
- 9:30 & 10:22: Colonial manually shut two local valves on either side of the river
- 10:20 AM: Fairfax Water is informed but told spill would be contained
- 12:45 PM: Fairfax Water staff observed plume from Route 7 bridge and judged it could not be contained
- By 7:00 PM:
  - Booms deployed at 6 spill-control points on Sugarland Run
  - 150-person crew, 8 tanker and 5 vacuum trucks on the scene
- 7:45 PM: Fairfax Water intake is closed due to arrival of oil

## Spill impacts

**Fairfax Water** 

### Hearings and studies

- Hearing House Subcommittee on Investigations & Oversight, Committee on Public Works & Transportation, May 18, 1993
- Colonial Pipeline Oil Spill, Reston, Virginia, Final Restoration Plan and Environmental Assessment, DOI, VADEQ, DCDOH, 1999
- National Transportation Safety Board, Pipeline Special Investigation Report, 2002

### PIPELINE SPECIAL INVESTIGATION REPORT

#### **EVALUATION OF ACCIDENT DATA AND FEDERAL OVERSIGHT OF PETROLEUM PRODUCT PIPELINES**

### Changes in pipeline safety regulations: 49 CFR 195

- Pipeline integrity monitoring via "smart pigs"
  - Pre-1993: recommended
  - Pipeline assessments 2000
- Shutoff valve spacing
  - Pre-1993: recommended
  - New requirements in 2022?
- Installation of remote valve control
  - Pre-1993: recommended
  - New requirements in 2022?
- "Unusually sensitive areas" (USAs) defined, including drinking water sources without adequate alternative supply (2000, 2021)

#### How smart PIGs keep pipelines safe Smart PIGs are probes that clean and inspect pipelines to prevent leaks and environmental damage. In a natural gas line, PIGs are powered by natural gas pressure pushing them onward. Outfitted with computers, GPS, sensors and magnets that transmit data to engineers, smart PIGs can pinpoint any signs of trouble. WHAT THEY LOOK FOR: Stress, corrosion, gouges, dents and cracks. WHY ARE THEY CALLED PIGs? In addition to being an acronym for Pipeline Inspection Gauges, they also make a squealing noise when running through a pipe. HOW BIG ARE THEY? When PIGs are used to inspect Duke Energy natural gas lines, they can be up to 18 feet long and can inspect pipes that are up to 30 inches in diameter. **PIPE WALL** CALIPER SENSORS BATTERY AND DATA STORAGE CONTAINER THICKNESS SENSORS measures any dents on are powerful magnets. the pipe DRIVE CUPS ODOMETER WHEELS for propulsion keep the PIG centered in the pipe and through the pipe measure speed and distance traveled.

Changes in regional communications

- ICPRB Spill Team notifications
  - Post-1993: CO-OP 24/7 beeper
  - Circa 2010: ICPRB 24/7 answering service
- Communications
  - Early years telephone
  - 2016: PotomacSpills.groups.io Listserv

# Changes in time of travel tools

1-dimensional (1-D) computer models – <u>dissolved</u> contaminants

- ERSM (ICPRB), 1985
- RiverSpill/ICWATER (federal agencies), 2002
- WaterSuite (Corona/MWCOG)

2-dimensional (2-D) computer models – <u>floating</u> contaminants

## ICPRB 2-D oil spill modeling

- NOAA's GNOME oil transport model
  - Patuxent Reservoir
  - Occoquan Reservoir
  - Potomac mainstem
- DELFT3D 2-D flow model
  - Potomac mainstem

# Changes in mitigation strategies

- Regional spill vulnerability
  - DC & Arlington acutely vulnerable
  - WSSC Water quite vulnerable
  - Fairfax Water would become vulnerable post-1993
- Path to increasing resiliency
  - 2014-15: CO-OP Travilah Quarry feasibility studies
  - 2016: MWCOG resiliency study
  - 2017: CO-OP water supply alternatives study
  - 2020: USACE value planning study
  - 2021: ICPRB initiated outreach to Congress
  - 2022: WRDA 2022 authorized USACE feasibility study on secondary water source for our region
  - Outreach to obtain funding for USACE study

### Needs and next steps

### Exercises

- Exercise use of ICPRB's 2-D oil spill modeling tools
- Engage with Colonial and PHMSA to learn about changes in our region since 1993

### Response

• Find funding for real-time version of ICPRB's 2-D Potomac River oil spill model

### Mitigation

- Continue progress on implementing supplemental storage for the region
- Find funding for lower cost measures in USACE's value planning study?
